Assignment – 6

(Entry & Exit control loops)

1. Input a number and check whether it is an Armstrong number or not.
2. Input a number and find all the prime factors of that number.
3. Print a Fibonacci series up to the nth term.
4. Find the sum of all the digits, count and print those digits from the result number which are also present in the original number.
5. Find all 4-digit numbers that satisfies the condition that, square of (First two digit + last two digit) = original number. Eg, if number is 3025 then $(30+25)^2 = 3025$.
6. Multiply all the digits of a number till a single digit is found. Zeros should be ignored from the numbers. Ex- if the number is 406, then the result should be 8.
